Practice quiz on Bayes Theorem and the Binomial Theorem

TOTAL POINTS 9

 A jewelry store that serves just one customer at a time is concerned about the safety of its isolated customers. 1/1 point

The store does some research and learns that:

- 10% of the times that a jewelry store is robbed, a customer is in the store.
- A jewelry store has a customer on average 20% of each 24-hour day.
- The probability that a jewelry store is being robbed (anywhere in the world) is 1 in 2 million.

What is the probability that a robbery will occur while a customer is in the store?

- $\frac{1}{500000}$
- $\bigcirc \frac{1}{2000000}$
- \bigcirc $\frac{1}{4000000}$
- $\bigcirc \quad \frac{1}{5000000}$

✓ Correct

What is known is:

A: "a customer is in the store," P(A)=0.2

B: "a robbery is occurring," $P(B)=\frac{1}{2,000,000}$

 $P(a \text{ customer is in the store} \mid a \text{ robbery occurs}) = P(A \mid B)$

$$P(A \mid B) = 10\%$$

What is wanted:

 $P(a \text{ robbery occurs} \mid a \text{ customer is in the store}) = P(B \mid A)$

By the product rule:

$$P(B \mid A) = \frac{P(A,B)}{P(A)}$$

and
$$P(A,B) = P(A \mid B)P(B)$$

Therefore:

$$P(B \mid A) = \frac{P(A \mid B)P(B)}{P(A)} = \frac{(0.1)(\frac{1}{2000000})}{0.2} = \frac{1}{4000000}$$

2. If I flip a fair coin, with heads and tails, ten times in a row, what is the probability that I will get exactly six heads?

1/1 point

- 0.021
- 0.187
- 0.2051
- 0.305
 - ✓ Correct

By Binomial Theorem, equals

$$\binom{10}{6} \left(0.5^{10}\right)$$

$$= \left(\frac{10!}{4! \times 6!}\right) \left(\frac{1}{1024}\right)$$
$$= 0.2051$$

 $_{3\cdot}$ If a coin is bent so that it has a 40% probability of coming up heads, what is the probability of getting exactly 6 heads in 10 throws?

1/1 point

- 0.0974
- 0.1045
- 0.1115
- 0.1219

$${10 \choose 6} \times 0.4^6 \times 0.6^4 = 0.1115$$

4. A bent coin has 40% probability of coming up heads on each independent toss. If I toss the coin ten times, what is the probability that I get at least 8 heads?

1/1 point

- 0.0132
- 0.0213
- 0.0312
- 0.0123

✓ Correct

The answer is the sum of three binomial probabilities:

$$(\left(\begin{smallmatrix} 10 \\ 8 \end{smallmatrix}\right) \times (0.4^8) \times (.6^2)) + (\left(\begin{smallmatrix} 10 \\ 9 \end{smallmatrix}\right) \times (0.4^9) \times (0.6^1)) +$$

$$(\binom{10}{10})\times (0.4^{10})\times (0.6^0))$$

5. Suppose I have a bent coin with a 60% probability of coming up heads. I throw the coin ten times and

	it comes up heads 8 times.	
	What is the value of the "likelihood" term in Bayes' Theorem the conditional probability of the data given the parameter.	
	0.168835	
	● 0.120932	
	0.043945	
	O 0.122885	
	✓ Correct Bayesian "likelihood" the p(observed data parameter) is	
	p(8 of 10 heads coin has p = .6 of coming up heads)	
	$\binom{10}{8} imes (0.6^8) imes (0.4^2) = 0.120932$	
5.	We have the following information about a new medical test for diagnosing cancer.	1/
	Before any data are observed, we know that 5% of the population to be tested actually have Cancer.	
	Of those tested who do have cancer, 90% of them get an accurate test result of "Positive" for cancer. The other 10% get a false test result of "Negative" for Cancer.	
	Of the people who do not have cancer, 90% of them get an accurate test result of "Negative" for cancer. The other 10% get a false test result of "Positive" for cancer.	
	What is the conditional probability that I have Cancer, if I get a "Positive" test result for Cancer?	
	**Formulas in the feedback section are very long, and do not fit within the standard viewing window. Therefore, the font is a bit smaller and the word "positive test" has been abbreviated as PT.	
	O 9.5%	
	O 4.5%	
	igodeligap 32.1% probability that I have cancer	
	O 67.9%	
	\checkmark Correct I still have a more than $\frac{2}{3}$ probability of not having cancer	

✓ Correct
 I still have a more than ²/₃ probability of not having cancer

 Posterior probability:
 p(I actually have cancer | receive a "positive" Test)
 By Bayes Theorem:
 = (chance of observing a PT if I have cancer)(prior probability of having cancer) (marginal likelihood of the observation of a PT)
 = p(receiving positive test| has cancer)p(has cancer [before data is observed])
 = p(positive | has cancer)p(has cancer) p(no cancer)

```
= (90%)(5%) / ((90%)(5%) + (10%)(95%)
           =32.1%
7.\;\; We have the following information about a new medical test for diagnosing cancer.
    Before any data are observed, we know that 8\% of the population to be tested actually have Cancer.
    Of those tested who do have cancer, 90\% of them get an accurate test result of "Positive" for cancer.
    The other 10\% get a false test result of "Negative" for Cancer.
    Of the people who do not have cancer, 95\% of them get an accurate test result of "Negative" for cancer.
    The other 5\% get a false test result of "Positive" for cancer.
   What is the conditional probability that I have cancer, if I get a "Negative" test result for Cancer?
   99.1%
   ○ .80%
   0.9%
   ○ 88.2%
       ✓ Correct
           p(\text{cancer} \mid \text{negative test}) =
                             p(\text{negative test} \mid \text{Cancer}) p(\text{Cancer})
            p(\text{negative test} \mid \text{cancer}) p(\text{cancer}) + p(\text{negative test} \mid \text{no cancer}) p(\text{no cancer})
                   (10\%)(8\%)
            (10\%)(8\%)+(95\%)(92\%)
            \tfrac{0.8\%}{0.8\% + 87.4\%}
            = 0.9\%
8. An urn contains 50 marbles - 40
   blue and 10 white. After 50 draws, exactly 40 blue
   and 10 white are observed.
   You are not told whether the draw was done "with
   replacement" or "without replacement."
   What is the probability that the
   draw was done with replacement?
   87.73%
   12.27%
   0 1
   0 13.98%
       ✓ Correct
```
